

Proje Kontrol Listesi

1. Backend Configuration:

- Database Models: Define your models for objects like User, Post, Comment.
- Authentication and Authorization: Set up a JWT-based authentication system.
- Permission Control: Add permission controls for a user to manage their own content.
- API Endpoints: Create RESTful API endpoints for users, posts, comments, and profile updates.
- Security: Implement security measures such as CORS, rate limiting, and data validation.

2. Frontend Configuration:

- Routing: Use a routing manager for SPA.
- State Management: Use a state management library to manage user session information and application state.
- User Interface: Create UI components.
- API Requests: Use an HTTP client for making requests to the backend.
- Authorization Checks: Control content display and redirections based on authorization status.

3. Integration and Testing:

- Backend and Frontend Integration: Validate API requests from the frontend to the backend.
- Testing: Write unit and integration tests.
- Security Testing: Test against vulnerabilities like SQL Injection, XSS, and CSRF.

Step by Step Progress: Develop and test each feature separately.

Code Review: Review the developed features for security and code quality.

Issue Division and Management: Break down and solve encountered issues piece by piece.
